BIOChem. 224:923-930(1994).

FUNCTION: SHOWS ACTIVITY ON LICHENAN, BETA-GLUCAN AND LAMINARIN BUT NOT ON CMC CELLULOSE OR XYLAN.

CATALYTIC ACTIVITY: Hydrolysis of 1,4-beta-D-glycosidic linkages in beta-D-glucans containing 1,3- and 1,4-bonds.

MISCELLANEOUS: The enzyme has a temperature optimum of 85 degree: Celsius and a pH optimum of 7.0.

SIMILARITY: BELONGS TO FAMILY 16 OF GLYCOSYL HYDROLASES.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Ş
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The present sequence represents the Eisenia foetida coelomic cytolytic factor 1 (CCF-1). The protein has antiparasitic, antibacterial and cantinflammatory activity. Recombinant coelomic cytolytic factor 1 (CCF-1) is trypanolytic for the African trypanosome Trypanosoma brucei in a dose-dependent manner. The trypanolytic activity of rCCF-1 can be cinhibited by anti-CCF-1 and anti-tumour necrosis factor (TNF)/TIP composition and anti-tumour necrosis factor (TNF)/TIP composition and the ruthermore, N,N'-diacetlychitoblose inhibits coelonal antibodies. Furthermore, N,N'-diacetlychitoblose inhibits coelonally trypanolytic activity of rCCF-1. These data corroborate the cfindings that CCF-1 is bares a trypanolytic, lectin-like domain with composition and the rate of treat trypanosomal or bacterial infections corroborate. The proteins and peptides are also useful in tumour therapy, cinflammation and other areas of immunology. The annelid peptide is corroborate tumour necrosis factor-alpha (TNF-alpha), and may be used as an alternative for TNF-alpha (TNF-alpha), and may be used as
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Query Match

The invention discloses genomic DNA sequences (ABL01840-ABL16175) and the encoded proteins (ABL0721).

The sequence (ABC0721).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                   The sequence data for this patent did not form specification, but was obtained in electronic f

                                                                                                                                                                              This sequence comprises the polypeptide precursor of a novel Coerskovia xanthineolytica enzyme that exhibits beta-1,3-glucanase (BG) activity. Its amino acid sequence was deduced from an isolated genomic DNA sequence (see AAT89157). Claimed DNA constructs that encode the novel BG (see Also AAW29455), a mannose binding domain (see AAW29456) or a full-length enzyme, i.e. BG with mannose binding domain (see AAW29456), can be used to produce recombinant BG or bacterial host cells. BG polypeptides are used for the degradation or modification of beta-glucan containing material, especially for the gentle lysis of microbial cell walls, thereby canabling recovery of desirable intracellular products with a reduced amount of contaminants. They can also be used to the extracts, pharmaceuticals, food or feed compositions, and to

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            200
```

This sequence comprises the polypeptide precursor of a novel oberskovia xanthineolytica enzyme that exhibits beta-1.3-glucanase (BG) activity and which includes a mannose binding domain (MBD). Its amino acid sequence was deduced from an isolated genomic DNA sequence (see AAT89156). Claimed DNA constructs that encode the novel BG lacking a MBD (see AAW29455 and AAW29457), a MDB (see

BG polypeptides are used for the degradation or modification of beta-glucan containing material, especially for the gentle lysis of microbial cell walls, thereby enabling recovery of desirable intracellular products with a reduced amount of contaminants. They can also be used for the production of e.g. pigments, colourants, flavourants, yeast extracts, pharmaceuticals, food or feed compositions, and to prepare protoplasts for use in fusion, transformation and cloning

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  AAW29458) or a full-length enzyme, i.e. BG with mannose binding domain (see AAW29456), can be used to produce recombinant BG polypeptides, with or without a mannose binding domain, in fungation or bacterial host cells. BG polypeptides are used for the degradation or modification of beta-glucan containing material, despecially for the gentle lysis of microbial cell walls, thereby enabling recovery of desirable intracellular products with a reduced amount of contaminants. They can also be used for the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       acid sequence was deduced from an isolated genomic DNA sequence (see AAT89155). Claimed DNA constructs that encode the novel BG also AAW29456 for corrected sequence), a mannose binding domain
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       production of e.g. pigments, colourants, flavourants, yeast extracts, pharmaceuticals, food or feed compositions, and to prepare protoplasts for use in fusion, transformation and compositions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           New isolated beta-1,3-glucanase enzyme xanthineolytica, used particularly for for obtaining desirable products
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        enzyme that exhibits beta-1,3-glucanase (BG) activity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This polypeptide comprises a novel Oerskovia xanthineolytica
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Example 2; Page 35-36; 64pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Diers

The protein was isolated from the haemolymph of fifth stage B.mori larvae after injection with Enterobacter cloacae strain 57-9. Partial amino acid sequence was used to generate PCR primers (AAT10280-1). These amplified a fragment of the gene used as a probe to obtain the full length gene (AAT10879) by screening a cDNA library derived from B.mori previously injected with heat-killed E.cloacae. The protein or fragments of it, can be used to treat diseases associated with LPS complexes e.g. septic shock, to remove LPS from products used for injection and to protect transgenic plants e.g. vines, tobacco, tomato or potato, against fungal infections.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              WPI;

```

This is the amino acid sequence of the full length lipopolysaccharide (LPS) binding protein from Bombyx mori. The protein was isolated from the haemolymph of fifth stage B.mori larvae after injection with Enterobacter cloacae strain 57-9. Partial amino acid sequence was used to generate PCR primers (AAT10280-1). These amplified a fragment of the gene used as a probe to obtain the full length gene by screening a CDNA library derived from B.mori previously injected with heat-killed E.cloacae. The protein or fragments of it, can be used to treat diseases associated with LPS complexes e.g. septic shock, to remove LPS from protein or fragments of the protein or protein the first threat the protein or the second for the protein or fragments of it.

products used for injection and to protect transgenic plants tobacco, tomato or potato, against fungal infections.

The new enzyme is derived from alkaoplhilic Bacillus Sp. The enzyme acts on beta-1,3-glucans to form glucose and laminaribiose. It is stable over a wide pH range with opt. activity at weakly actidic pH and has good heat resistance.

                                                                                                                                                                                                                                              Drosophila melanogaster
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           A novel beta-1,3-glucanase (AAR97362) from Oerskovia xanthineolytica LLG109 is useful for degrading or modifying beta-glucan-contg. material. Its amino acid sequence was deduced from a genomic DNA sequence (AAT29043) isolated from an O. xanthineolytica library. Recombinant beta-1,3-glucanase can be produced on a large scale using transformed host cells, esp. Bacillus subtilis DN1885 or ToC46. Protease-free beta-1,3-glucanase can be obtd. that is useful for lysing fungal cell walls, allowing recovery of intracellular proteins. The enzyme is also useful for the prepn. of protoplasts and for the prodn. of pigments, colorants, flavours, yeast extract
                                                                                                                                                                                                                                                                                                       26-MAR-2002
                                                                                                                                                                                                                                                                                                                                                              ABB61180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            DNA construct encoding enzyme with beta-1,3-glucanase activity - useful for modifying or degrading beta-glucan contg. material and the prepn. of e.g. food colourants, flavourings and yeast extracts

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIG176-ABL30511), expressed DNA sequences (ABLIG175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             23-MAR-2000;

The present sequence represents the Flavobacterium keratolyticus endo-beta-galactosidase (designated ENDO-A) protein. The ENDO-A protein can be used in conjugation with alpha-N-acetylgalactosaminidase to remove externally and internally linked A antigen on group Al erythrocytes. The resulting erythrocytes may be transfused into individuals who would be otherwise unable to safely tolerate a transfusion of type Al blood. The ENDO-A protein can also be used to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New isolated endo-beta-galactosidase - from Flavobacterium keratolyticus, used particularly for de-antigenising human erythrocytes bearing Al antigen for blood transfusions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     alpha-N-acetylgalactosaminidase;

The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABLIG176-ABL30511), expressed DNA sequences (ABLIG176-ABL30511), expressed DNA sequences (ABLIG175) and the encoded proteins
                                                                                                                                                                                                                                                                                                                                                                                                                                      The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from at ftp.wipo.int/pub/published_pct_sequences.

                                                                                                                      The invention relates to an isolated nucleic acid detection reagent capable of detecting 1000 or more genes from Drosophila. The invention useful in developmental biology and in elucidating cell signalling and cell-cell interactions in higher eukaryotes for the development of insecticides, therapeutics and pharmaceutical drugs. The invention discloses genomic DNA sequences (ABIJ6176-ABIJ63511), expressed DNA sequences (ABIJ6176-ABIJ63511), expressed DNA sequences (ABIJ6176-ABIJ63511).
                                                                      The sequence data for this patent did not form specification, but was obtained in electronic f at ftp.wipo.int/pub/published_pct_sequences.
